Aconex Field

Countless projects are using a combination of disconnected tools and systems, including outdated paper and clipboards, to manage on-site inspections. This leads to hours wasted entering and re-entering inspection data, increased risk of errors, poor quality outcomes, and potentially compromises the safety of site staff.

Cut inspection times in half with Aconex Field

It's time to automate and standardize with Aconex Field, an easy-to-use cloud and mobile application for managing inspections. Enjoy fast inspections and resolution, complete and accurate data capture, and in-depth reporting and insights across your project or portfolio.

No matter what type of inspection, Aconex Field can capture it, manage it, and report on it out on site.
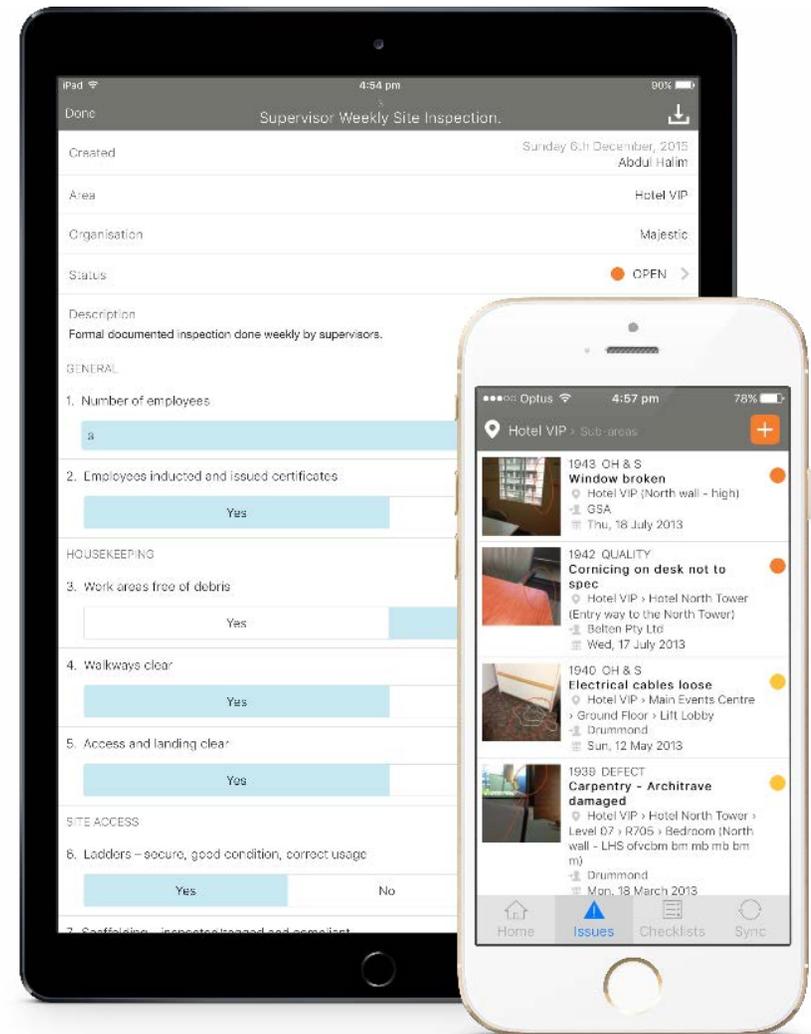

The Aconex difference

One view of all project and process data

Stop wasting time consolidating data from multiple systems. Unlike point solutions, Aconex Field is part of the industry's leading end-to-end project management platform. All project information and processes, including inspection data, is kept in one secure location, providing a single view into how your project and portfolio is performing.

Easy to use, for everyone

A strong focus on user experience and an intuitive interface has helped make Aconex Field the award-winning cloud and mobile tool it is today. Easy to use input screens make capturing inspection data simple, and subcontractors can quickly see what work is assigned to them and mark it as 'complete' when the work is done. With apps for iOS and Android devices, teams can remain productive from anywhere.

"Aconex Field has significantly increased our quality and efficiency on this project."

Ken McNeill, Site Manager, Multiplex

Key Capabilities:

• Inspections – Checklists and Forms: Manage punch list inspections, safety walks and hazard observations, permits, quality audits and more. Use your own forms and templates to ensure compliance or minimize change management impacts. Raise issues against nonconforming items and monitor progress with due dates and ball-in-court tracking.

• Issue management: Capture and action QA/QC items to minimize site risk, reduce expensive rework and improve construction quality. Attach multiple photos, mark them up for extra context, and assign them for resolution. Subcontractors always have an up-to-date list of outstanding work on their mobile device, so nothing is overlooked.

• Reporting and analysis: Report on live, real time inspection data. Gain insight into inspection performance at the portfolio, project or organizational level to identify red flags early and make informed decisions. Stay in control and keep your jobsite running smoothly and efficiently.

• Offline access: Stay productive when no data connection is available. Create or edit checklists, start a new inspection, get the job done. Information captured will sync back automatically when connectivity is restored.

• Standardization: Standardize inspection processes across a project or your whole portfolio. Choose from a library of checklists and forms templates or create your own, and use categories to make them easy to find and use.

• One platform: Aconex integration means all project and process data is securely stored on one platform, providing a single audit trail and complete project record.

• Integration via API: Eliminate double data entry by automating the flow of information between Aconex Field and other software systems, creating a single view of your data.
